

Background: This activity demonstrates how Prisma Cloud alerts on attacks on cloud resources and how you can leverage the Prisma Cloud data correlation to analyze the attacks in more detail and remediate them. **In this activity, you will:**

- View Alerts on risky SQL, Code injection, and other attacks.
- Analyze the attack paths and the resources involved in them.
- View how Prisma Cloud can be leveraged to remediate and block the attacks.

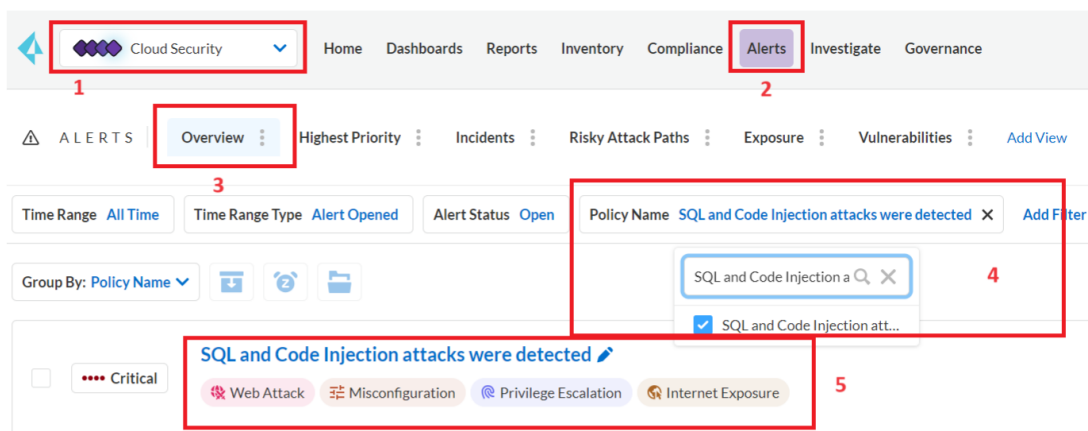

Note: This is a standalone activity and is not dependent on other activities.

----- Task 1: Investigate Attacks on Cloud Resources -----

Step 1. Navigate to **Prisma Cloud Enterprise Edition > Cloud Security > Alerts > Overview**.

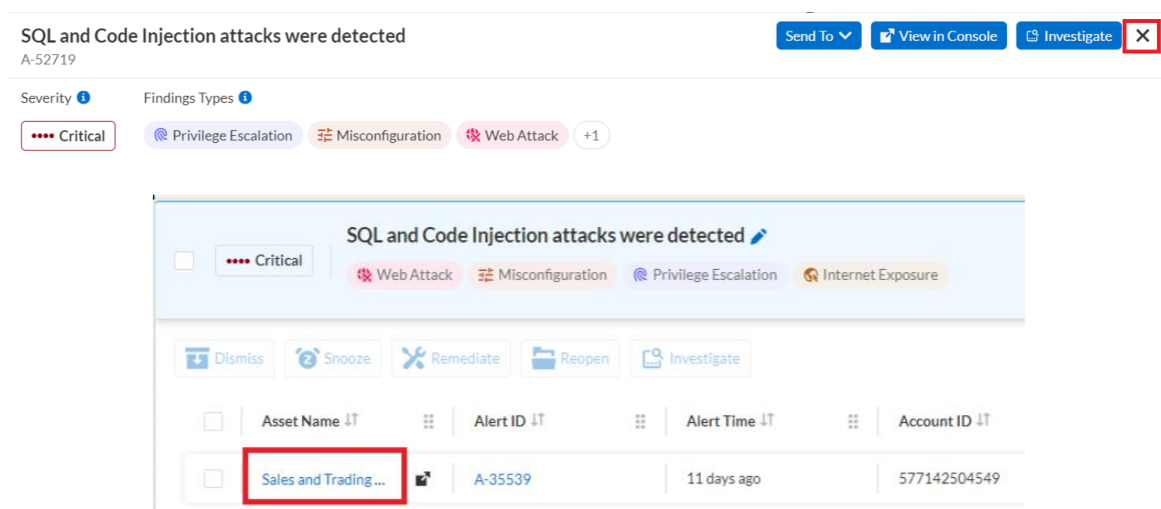

Step 2. Set the following filters (you can add additional filters by clicking on the **Add Filter** button):

- Time Range = **All Time**
- Policy Name = **SQL and Code Injection attacks were detected**

Notes: **SQL and Code Injection attacks were detected** is a custom search policy and Alert rule that was created for the lab by leveraging out-of-the-box Prisma Cloud policies. This is done for ease of use and convenience of lab experience.

Step 4. Click on the **SQL and Code Injection attacks were detected** result and click on the **Sales and Trading cnsnp-app4** under the **Asset Name** column.

Step 5. This should bring up details about this instance and contain more findings and information about the attacks. The **Overview** tab contains the overview of this VM. Clicking on the **Attack Path** will reveal how the attack occurred and the resources involved in it.

A-52629 Remote code execution (RCE) risk due to a publicly exposed AWS EC2 instance with Spring4Shell vulnerability

A-52629 Remote code execution (RCE) risk due to a publicly exposed AWS EC2 instance with Spring4Shell vulnerability
This policy identifies AWS EC2 instances which have Spring4Shell vulnerabilities and are publicly exposed. The Spring4Shell vulnerability allows att...

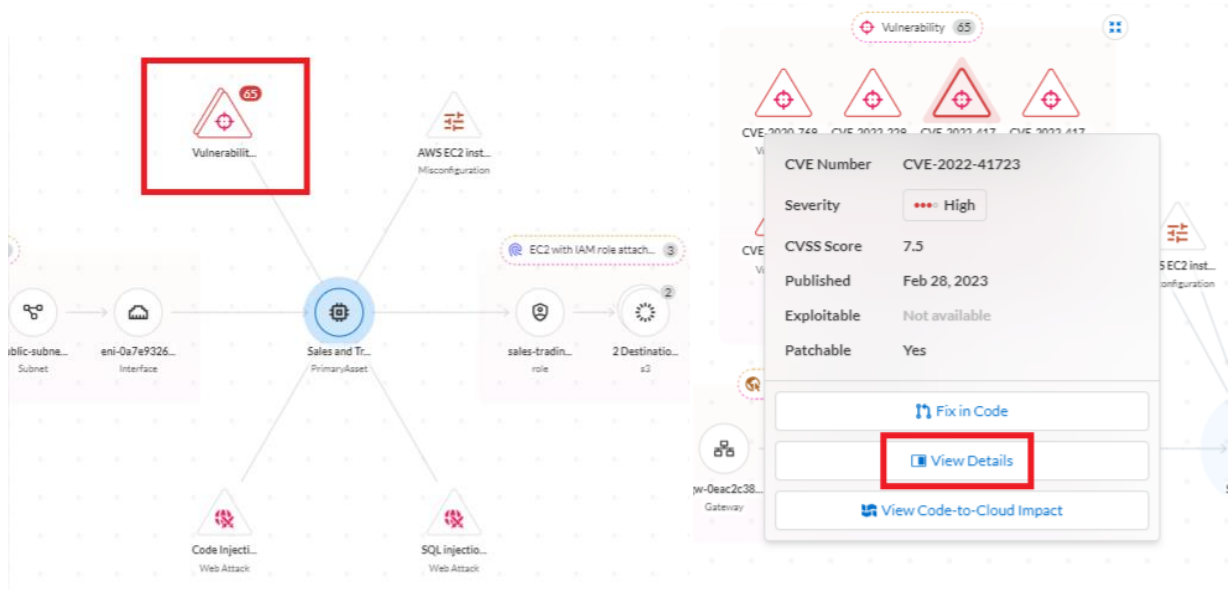

A-52719 SQL and Code Injection attacks were detected

A-52719 SQL and Code Injection attacks were detected

The diagram illustrates the attack path for finding A-52719. It shows a sequence of resources: Internet Gateway (igw-0eac2c38...) → VPC (demo-foundat...) → Subnet (public-subne...) → Interface (eni-0a7e9326...). These lead to the primary asset, 'Sales and Trading' EC2 instance. This instance is associated with several findings: 'Vulnerability' (65), 'AWS EC2 inst... Misconfiguration', 'EC2 with IAM role attach...' (3), 'Code Injecti... Web Attack', and 'SQL injectio... Web Attack'. The EC2 instance is also linked to IAM roles: 'sales-tradin... role' and 'prisma-cloud... s3', which in turn are linked to S3 buckets: 's3' and 'prisma-cloud... s3'.

Step 6. Within the graph, you can see the traffic flow and the complete attack path. The traffic enters through the **Internet Gateway** and hits the **Sales and Trading EC2** instance. This instance has an IAM role **sales-trading-admin-role-cnsp-app4** attached to it, which has **wildcard access to the S3 bucket** and also access to the **prisma-cloud-pcds-bucket** S3 Bucket. As this instance is vulnerable to **SQL and Code injection attacks**, the attacker can potentially perform a **Data exfiltration** from the S3 bucket through the compromised host. This is represented by the Attack Path.

Step 7. Within the graph, clicking on the **Vulnerabilities** icon and clicking on any **Vulnerability** will provide more information about the vulnerability. On the selected Vulnerability, clicking on **View Details** will open an additional findings sidecar.

CVE-2022-41723

Remediate Send To X

CVSS 7.5 Impacted Stages Code Deploy Run Severity High Risk Factors +2 More

Overview Assets

Details

cve	CVE-2022-41723
Description	A maliciously crafted HTTP/2 stream could cause excessive CPU consumption in the HPACK decoder, sufficient to cause a denial of service from a small number of small requests.
Package Name	golang-1.15
Fix Version	
Impacted Version	[*]
Published Date	Feb 28, 2023
Cpu Arch	

Step 8. Clicking on **Assets** will show more information about the affected assets. Once done, close the **CVE Sidecar**.

CVE-2022-41723

Remediate Send To X

CVSS 7.5 Impacted Stages Code Deploy Run Severity High Risk Factors +2 More

Overview Assets

Risk Factor Select

1 Packages	Associated Repositories Count 1	Fix Impact 8% of all Code Vulnerabilities Across 1 Associated Repositories	Actions	
4 Hosts	Associated Host VM images Count 0	Fix Impact 33% of all Runtime Hosts	Actions	

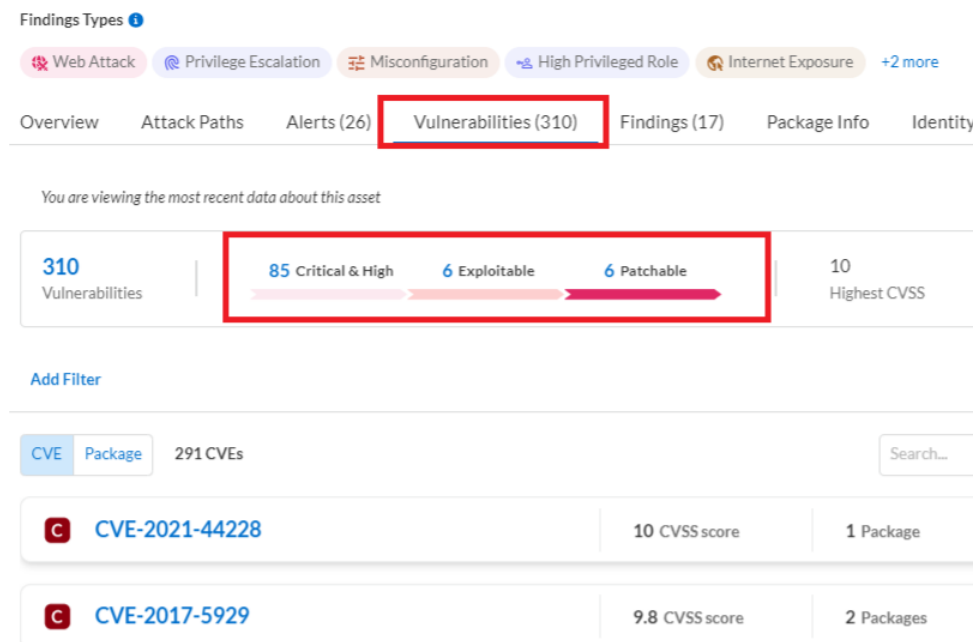

Step 9. Clicking on **Audit Trail** will show more information about what changes occurred at the resource level and the timeline.

The **Alerts** tab will show all the alerts that are that this resource is currently involved in.

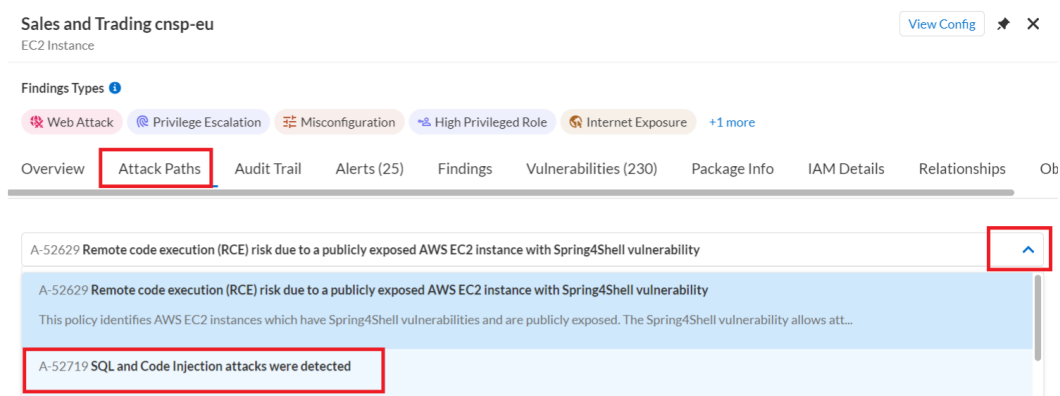

The **Findings** tab shows the findings for this specific resource.

Step 10. Within the **Sales and Trading cnsp-app4** VM sidecar, click on the **Vulnerabilities** tab to see all the Vulnerabilities that were detected for this VM. Further clicking on options such as **Critical & High**, **Exploitable** and **Patchable** will filter the results.

Step 11. Navigate back to the **Attack Path** graph (and make sure that the “**SQL and Code Injection attacks were detected**” alert is selected). Let’s further investigate the Attack Path in the graph and examine the blast radius.

Step 12. Within the graph, click on the S3 Bucket **prisma-cloud-pcdis-bucket** by clicking on it and clicking on **View Details**

The image shows two parts of the Prisma Cloud interface. The top part is an attack graph with a central node labeled 'Sales and Tr... PrimaryAsset'. It is connected to several other nodes: 'Vulnerabil...' (65), 'AWS EC2 inst...' (Misconfiguration), 'EC2 with IAM role attach...' (3), 'prisma-cloud... s3' (highlighted with a red box), 'SQL Injectio...' (Web Attack), 'Code Injecti...' (Web Attack), and 'eni-0a7e9326...' (Interface). The bottom part is a modal window for the 'prisma-cloud-pcdis-bucket' S3 Bucket. It shows the following details:

Asset Name	prisma-cloud-pcdis-bucket
Asset Class	Storage
Cloud Service	Amazon S3
Findings Types	Misconfiguration, Discovery
Findings	0 Misconfiguration, 0 Discovery
Vulnerabilities	0 Critical, 0 High, 0 Medium
Alerts	0 Alerts

Below the table, there is a 'View Details' button (highlighted with a red box) and a small icon of the bucket (also highlighted with a red box). To the right of the modal, the 'prisma-cloud-pcdis-bucket' details page is visible, showing tabs for Overview, Attack Paths, Audit Trail, Alerts (3), Findings (3), and Vulnerabilities (0). The 'Overview' tab is selected.

- a) Here you can see the S3 Bucket details. Head over to the **Alerts** tab in the S3 Bucket details and here you will see that there's an alert for this bucket- **Storage Asset with sensitive data found**. Do not click on the Policy Name as clicking on the Policy Name as you will be navigated to another page. Once done looking at Alerts, close the **Alert** window

Step 15. Click on the **SQL Injection** and click on **View Additional Finding Details**. You will now be directed to the **Prisma Cloud Runtime Security WaaS (Web Application and API Security)** console, which was responsible for detecting this attack. Here we will be able to see more information about the attack.

Note: The below screenshot might look different in your case as some menus are collapsed to fit the screenshot on the page.

Step 16. Click on the **SQL Injection** number to bring up the **Aggregated WaaS Events** for that attack type.

Time	IP	Co...	HTTP Host	Path	Query	Eff...	Count
Nov 1, 2023 3:3...	172.20.1.53		172.20.1.164:...	/	id=' OR '1	Alert	1
Nov 1, 2023 3:1...	172.20.1.53		172.20.1.164:...	/	id=' OR '1	Alert	1
Nov 1, 2023 3:0...	172.20.1.53		172.20.1.164:...	/	id=' OR '1	Alert	1
Nov 1, 2023 2:1...	172.20.1.53		172.20.1.164:...	/	id=' OR '1	Alert	1

Step 17. As you can see, attacks are detected and the effect is set to **Alert**. This can be changed to **Prevent** to prevent the attacks. But we will **not be performing** that action in this lab but we will show how it can be achieved.

Step 18. If you scroll further down, you can see which rule is responsible for detecting the attacks and this would be **finance-eks-cluster-waas-policy**. Click on the rule and select **Yes** for the pop-up dialogue.

Step 19. Click on the rule and click on the item under the App List

Rule name	Description (optional)
finance-eks-cluster-host-waas-policy
